

LABELLING FREIGHT FOR DISTRIBUTION

With the introduction of Forklift CCTV Scanning at Palletline, the correct application and positioning of each label is critical. To ensure our market-leading technology is 100% effective, labels must be:

- Attached towards the base of the pallet
- Aligned vertically to the centre
- Positioned no more than 30cm from the floor
- Printed clearly on Palletline labels (not A4 paper)
- Applied to a flat surface, outward facing
- Not torn, creased or wet
- Not obscured by wrapping material, including shrink wrap

HOW IT WORKS

CCTV Scanning is activated when a pallet is unloaded from the inbound vehicle. Once activated, the system logs the barcode and books the pallet in at the hub.

The CCTV camera records the pallet's journey from trailer to bay and the process is repeated when the pallet is loaded to the outbound trailer. Every CCTV clip is then accessible via our online portal in real-time and available for up to 30 days.

BENEFITS

- Enhanced tracking capabilities
- Real-time CCTV visibility of freight as it moves through the network
- Cloud-based storage accessible via an online portal
- Faster turnaround time at the hub to get your freight back on the road quicker
- Reduced human error through the automated process
